

1    **ABSTRACT OF THE DISCLOSURE**

2            A runner for an extension table that has two sliding leaves includes a  
3    wooden primary transverse beam with a side, a wooden secondary transverse  
4    beam attached securely to the side of the primary transverse beam and a track  
5    assembly attached to the side of the primary transverse beam. The secondary  
6    transverse beam has a top. The track assembly is supported by being fitted on the  
7    top of the secondary transverse beam. Therefore, the secondary transverse beam  
8    provides a robust support to the track assembly to prevent that from being  
9    deformed or separated when the track assembly undergoes an accumulated  
10   weight caused by stacking the extension tables during a period of transport or  
11   storage.
